Task 06: CSS Basics and Traditional Styling

To Learn: Learn the CSS rules that form the foundation of almost every stylesheet. Start with the traditional CSS model before moving to modern layout systems.

Task description: Study the following CSS concepts, properties, selectors, and at-rules. Practice each one in a small HTML file. For every topic, change at least one value and observe the result in the browser.

- CSS syntax: selector, property, value, declaration, declaration block, and CSS rule.
- How to apply CSS: inline styles, internal <style>, and external .css files. Understand when each approach is appropriate.
- Selectors: element/type selectors, class selectors, ID selectors, universal selector (*), grouping selectors, and attribute selectors.
- Combinators: descendant, child (>), adjacent sibling (+), and general sibling (~).
- Cascade: source order, importance, specificity, inheritance, and why one rule overrides another.
- Comments and formatting: /* comment */, indentation, grouping related rules, and readable CSS.
- Colors: named colors, hexadecimal, rgb(), rgba(), hsl(), hsla(), and transparency.
- Text properties: color, text-align, text-decoration, text-transform, text-indent, letter-spacing, word-spacing, line-height, white-space, text-overflow, and text-shadow.
- Font properties: font-family, font-size, font-weight, font-style, font-variant, line-height, shorthand font, web-safe fonts, and @font-face basics.
- Backgrounds: background-color, background-image, background-repeat, background-position, background-size, background-attachment, and shorthand background.
- Borders: border-width, border-style, border-color, border-radius, border shorthand, outline, and outline-offset.
- Units: px, %, em, rem, vw, vh, vmin, vmax, and when relative units are useful.
- Lists and links: list-style-type, list-style-position, list-style-image, link states, cursor, and basic hover styling.
- Basic visual effects: opacity, box-shadow, text-shadow, and simple gradients using linear-gradient() and radial-gradient().

Task Assignment: Personal Profile Styling

Assignment description: Build the following practical page using HTML and CSS. Reuse the CSS concepts learned on earlier days. The assignment should be functional and visually organized, not just a collection of isolated examples.

Assignment instructions:

- Use the HTML profile page created during HTML training as the base page.
- Create an external stylesheet named style.css and connect it with <link>.
- Style the page body with a font family, base font size, line height, background color, and text color.
- Style headings, paragraphs, links, lists, and the profile image.
- Create a profile header with a background color or gradient.
- Style links for normal, visited, hover, and active states.
- Create a visually distinct skills list using classes and list styling.
- Style the contact form fields, labels, textarea, and buttons.
- Use borders, border-radius, padding, shadows, and appropriate colors.
- Use at least 5 different CSS units, including px, %, rem, em, and vh/vw.
- Use at least 8 different selectors, including element, class, ID, attribute, descendant, child, adjacent sibling, and general sibling selectors.

- Demonstrate inheritance and specificity with at least two intentional examples, then explain which rule wins and why.
- Use a CSS gradient and at least one shadow.
- Keep HTML structure clean and put the main styling in the CSS file rather than inline styles.
- Use browser DevTools to inspect at least five elements and verify the applied rules.
